## **EXPANSION OF PHYSICAL FACILITIES**

### **Purpose:**

The addition of two floors to the existing building housing the LSU Eye Center and the Lions Eye Research Laboratories is now nearing completion. The Neuroscience Center will be occupying this space in February - March 1997. Plans for floors eight and nine have been included as an appendix of this volume.

The additional space will greatly enhance the capabilities of the research program of the Neuroscience Center. Many components of the eight research projects, as well as the associated Core research facilities and administrative units, will be housed in the new space. The benefits of the synergy created by proximity in the development of exciting new approaches to research problems related with Neural Responses to Injury: Prevention, Protection, and Repair will soon be realized. The centralization of the Core Research Facilities will allow cooperative usage and simplify oversight, reducing costs and eliminating duplication. Finally, the location of administrative functions in constant contact with the research facilities will permit efficient management and minimize wasteful miscommunications.

### **Use of funding:**

In addition to the \$5,731,635 funded through the present Cooperative Agreement, the Neuroscience Center has committed \$1,552,000 for costs associated with construction of floors eight and nine. These two additional floors, encompassing approximately 18,750 square feet of laboratory space, 8,200 square feet of Core Research Facilities space, 4,450 square feet of faculty and administrative office space, 8,725 square feet of conference and meeting rooms space, and animal facilities. Laboratory space will be allotted to investigators who are involved in collaborative studies

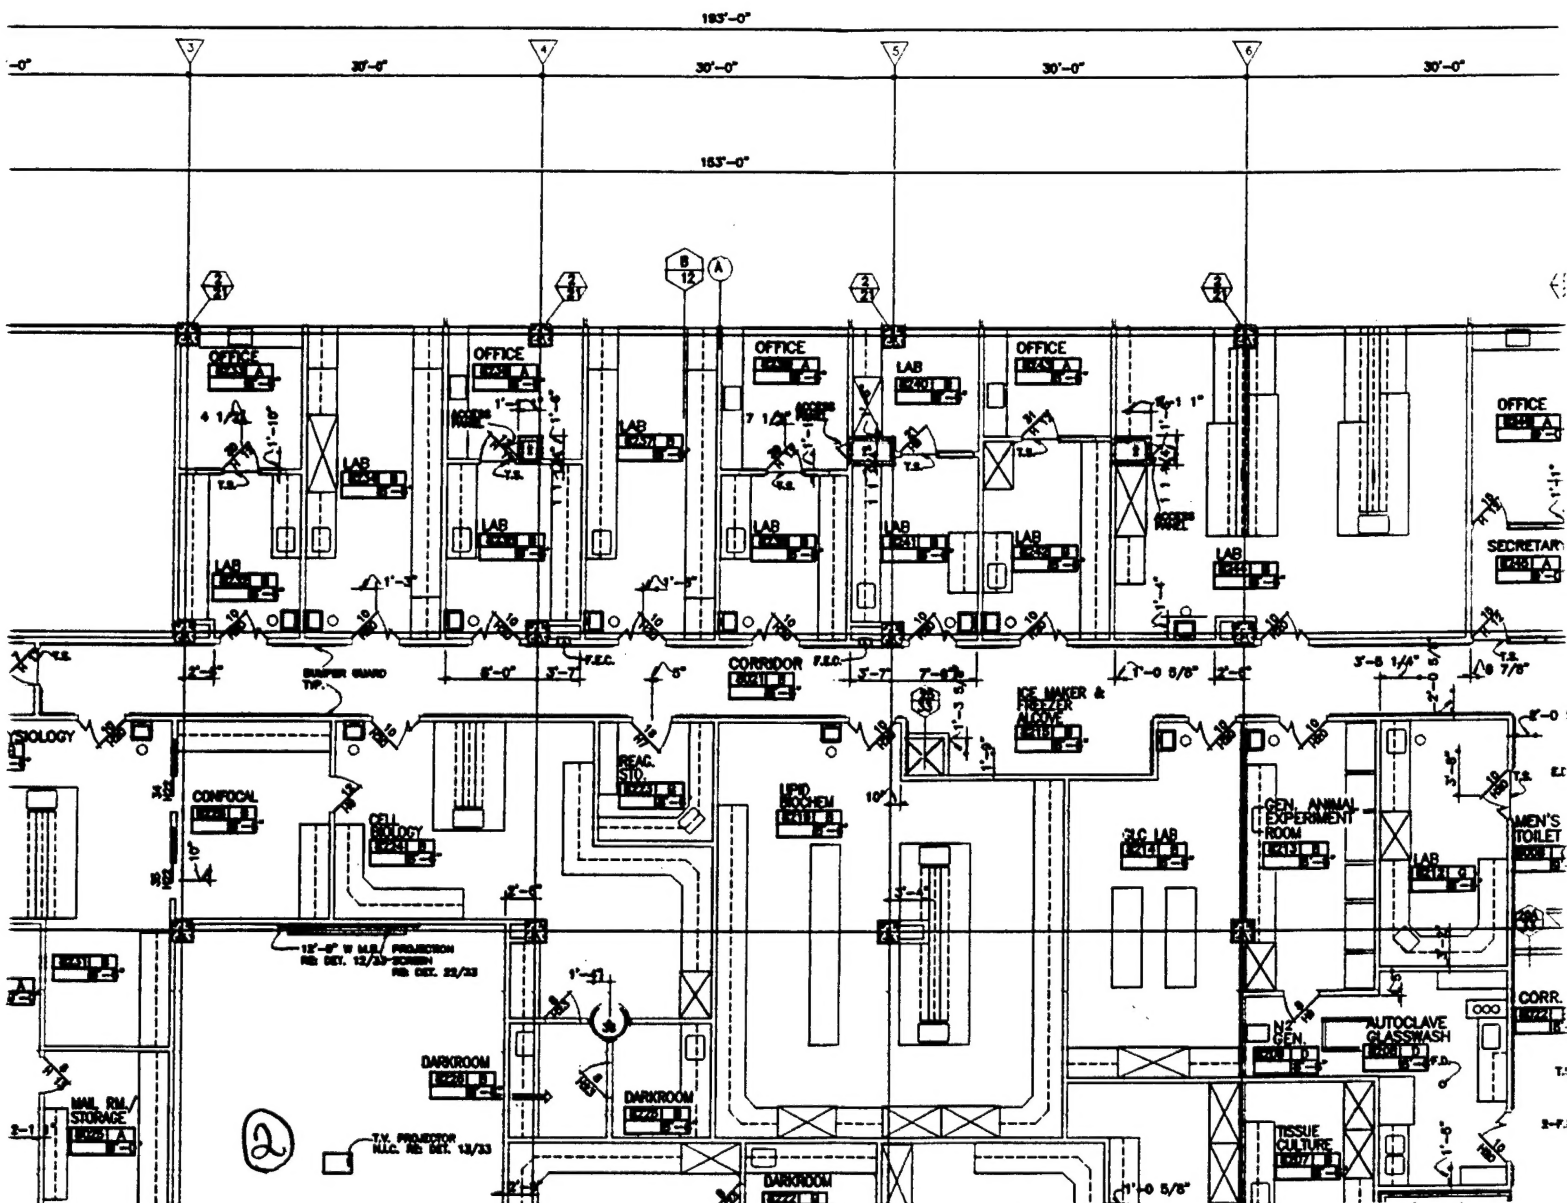

as described in this proposal; additional laboratory space will be made available for new investigators who address neural plasticity and molecular biological approaches to various aspects of neurobiology of disease and who will be recruited to enhance and expand these research projects. The Core Facilities space will bring together the state-of-art instrumentation acquired in conjunction with this project, as well as other equipment purchased through federal, private, and university funding sources. Faculty and administrative offices will be located close to the laboratory areas, to facilitate intellectual collaboration and management efficiency. The conference and meeting space will provide much needed facilities for seminars, committee meetings, formal and informal scientific interchanges, and interdepartmental and extrainstitutional symposia, all of which will provide a forum for the dissemination of information among the wide variety of scientists who are focused on the scientific problems and potential solutions of neuroscience research as proposed in the Cooperative Agreement.

The space will be the physical focus of neuroscience research projects in conjunction with the USAMRDC. The completion of the physical facilities will make possible the continuation and expansion of the current projects and initiation of new projects of relevant interest to the USAMRDC.
